ABSTRACT

The effectiveness of a peer leadership program connecting senior high school students with at-risk, new eighth-graders in seven Atlanta (Georgia) high schools is evaluated. The program trains the peer leaders in leadership and group dynamics and then places pairs of leaders with 10 or 12 advisees for weekly meetings. The study population includes 102 peer leaders and 498 student advisees for a total of 600 students. Study participants attended four regular high schools and three alternative high schools. In addition, for control groups, two regular and two alternative schools are included, for a total control group of 646 students. For regular high schools, the absence data and course failure data favor the peer leadership group of both advisees and peer leaders over the control group. On the other hand, the attendance data and course failure data for the alternative schools favor the control group over the program participants. Statistical data are presented in six tables. (JB)

Atlanta Public Schools
Peer Leadership Connection Report
Abstract
1989-90

The Atlanta Peer Leadership Connection is a program that began in several Atlanta secondary schools in 1989-90. A major objective of the program is to strengthen problem-solving and leadership skills of selected high school students. A cadre of upperclassmen (usually seniors) in each school was selected to be Peer Leaders and received intensive training related to leadership roles and group dynamics. Another major objective of the program is to assist students new to the school (usually entry-level students, i.e., eighth or ninth graders) in their social and academic adjustment to the setting. Peer Leaders were paired in groups of two with ten or twelve student advisees (new students) to provide extensive support for these new students. The model calls for Peer Leaders to be enrolled in a year-long, credit-bearing leadership course and for the Peer Leaders to meet on a weekly basis with their advisee group. The project was supported by the Coca-Cola Foundation. Training and ongoing technical assistance has been provided to the Peer Leaders, as well as faculty advisors, by Dr. Sharon Powell of the Princeton Center for Leadership Training, developer of the Peer Leadership Connection Model.

The targeted regular high schools were Archer, Douglass, Turner and West Fulton. The participating alternative high schools were North Avenue Academy, Rich's Academy, and West End Academy. The targeted grade levels were eighth and ninth grades (for student advisees) and twelfth grade (for Peer Leaders). The number of students impacted were 102 Peer Leaders and 498 student advisees for a total of 600 students.

Student absence data and course failure data for first and second semesters tend to favor participants in the Peer Leadership Program over the control group in the regular high schools. In the alternative high schools, though, student absence data and course failure data did not favor participants in Peer Leadership over a control group.

ATLANTA PEER LEADERSHIP CONNECTION

Report on Attendance and Course Failure Data for Peer Leadership Participants and Control Groups in Regular and Alternative High Schools 1989-90

Background

The Atlanta Peer Leadership Connection began operation in the 1989-90 school year in four regular Atlanta High schools and three alternative high schools. There is a two-pronged purpose of the program: 1) to develop problem-solving and leadership skills among identified seniors (Peer Leaders) and 2) to facilitate the adjustment of first-year high school students (advisees) to their new environment.

Dr. Sharon Powell, of the Princeton Center for Leadership Training, developed this training program and has been intimately involved in the training provided in Atlanta. She has reported that participation in this program should result in a number of behavior changes in students that can be observed. Peer Leaders can be expected to 1) exhibit increased confidence, 2) speak up more often, 3) demonstrate a greater willingness to take on different roles, 4) show more initiative, 5) manage conflict more effectively, 6) be more inquisitive, 7) demonstrate increased motivation, 8) be more responsible, 9) demonstrate improved rapport with teachers, and 10) show a greater appreciation for teachers. Advisees (new students) can be expected to 1) be happier, 2) have a greater sense of belonging, 3) speak up more, 4) be more motivated, 5) feel more "connected," 6) not feel isolated, 7) have more fun, 8) feel a part of the "family," and 9) have a decrease in discipline problems.

The Peer Leadership model calls for Peer Leaders to be enrolled in a year-long course to learn skills related to leadership and group dynamics. The advisees (new students) meet in groups of 10-12 with two Peer Leaders once per week. During the sessions the groups employ problem-solving and group cohesion techniques to develop peer relations and promote adjustment to high school.

Method

Program Participants and Control Students

Peer Leadership Connection was identified for implementation at seven sites which included four regular high schools and three alternative high schools. The regular high schools were: Archer, Douglass, Turner, and West Fulton. The alternative schools were the following academies: North Avenue, Rich's, and West End. Peer Leaders and advisees were selected by the staff at each site. Peer Leaders, usually seniors, were primarily selected for their potential to lead groups successfully. They did not have to be academically exceptional students, the most popular students at school, or members of the student council. The advisees, usually eighth graders, were to be selected because of their potential to reap the most benefits from the program. These students were those who may be "at-risk," those who were likely to have difficulty adjusting to the new high school environment. It was reported by the external evaluator, however, that the selection of some students had to be determined because of the student's class schedule. The external evaluator

reported in October 1990, that there was an extensive change in the Peer Leaders and advisees at Douglass High, at the beginning of the second semester in January 1990. The original Peer Leadership file was not updated, because this fact was not known by the Atlanta Public Schools researcher until after the data analysis was completed.

In November 1989, the names of students who were identified as Peer Leaders and advisees at each site were collected. A central computer file was created and some preliminary attendance data was compiled for the first forty days of school and the first eighty days of school in December 1989, and January 1990.

Four control schools were identified to allow for some preliminary comparisons of data trends. Two regular high schools, Harper and Washington, were selected as controls for the regular Peer Leadership high schools. These two schools were selected because all of the regular Peer Leadership schools encompassed grades 8-12. These were the only two other Atlanta high schools that had an eighth grade. Two alternative high schools, Central Academy and St. Luke's Academy, were selected because these were the two remaining Exodus schools.

Neither the Peer Leadership schools nor the participants (Peer Leaders and advisees) were randomly selected for this program. The control schools were also not randomly selected. However, within the control schools, a random selection of 16 seniors at each regular control high school and 10 seniors at each alternative school was made to identify control Peer Leaders. At the regular control high schools all eighth grade students were selected as control advisees. At the control alternative schools all students not selected as Peer Leaders were identified as control advisees, simulating the identification process at Peer Leadership alternative schools. (See Table 1 for an overview of the number of participants, peer leaders and advisees, reported by grade for regular Peer Leadership and control schools.) (See Table 2 for an overview of program participants reported by grade for alternative Peer Leadership and control schools.)

Design

There were a number of variables for which data is automatically collected and stored on central computer files, e.g. grades, standardized test scores, grade point averages, dropout data, suspension data, expulsion data, and attendance. However, two variables were identified by the contracted external program evaluator and central in-house evaluator as being most likely to be affected by participation in the Peer Leadership Program. These variables were school absence and the number of courses failed. More specifically, school absence was defined by the number and percentage of students who were absent "0 days," "1-5 days," "6-10 days" and "11 or more days" for the first five attendance periods and the remaining four attendance periods. Course failure was defined by the number and percentage of students who failed no courses, one course, or two or more courses, at the end of the first and second semesters.

Since students were not randomly selected nor were they randomly assigned to the Peer Leadership Program or a control group, basic requirements to apply tests of statistical significance to the data were not met. Instead, descriptive data were compiled in terms of the number and percentage of students by group (Peer Leaders and advisees), by school type (regular and alternative high schools), and was totaled by Peer Leadership and control schools.

Results

Attendance

Regular High Schools:

Table 3 provides a summary of data regarding student absences for Peer Leadership and control students in regular high schools. The percentages of advisees and Peer Leaders who were absent "0 days" were not as high as the respective percentages for the control group for both the first and second semesters. However, the percentages of advisees and Peer Leaders who were absent "11 or more days" were lower than the percentages for the control groups each semester. The largest percentage of program advisees was found in the category of "1-5 days" of absence for both first and second semester, while the largest percentage of control advisees was reported for the category of "11 or more days" of absence for both the first and second semesters.

The largest percentage of Peer Leaders fell in the category of "1-5 days" of absence for the first semester and "6-10 days" of absence for the second semester. The control Peer Leaders also had the largest percentage of students in the category of "1-5 days" of absence for the first semester. For the second semester an equally high percentage of control Peer Leaders fell into the categories of "1-5 days" of absence and "11 or more days" of absence.

When the two highest categories of days absent were combined, there was a lower percentage of program advisees absent six (6) or more days than the control advisee percentage; 48 percent versus 50 percent during the first semester; and 49 percent versus 54 percent during the second semester. When the two highest categories of days absent were combined, there was a somewhat lower percentage of Peer Leaders absent six (6) or more days than the "control" Peer Leader percentage for the first semester, 42 percent versus 44 percent, respectively. For the second semester there was a substantially higher percentage of Peer Leaders absent six (6) or more days when compared to the control Peer Leaders, 62 percent versus 50 percent.

Alternative Schools:

Table 4 provides a summary of data regarding student absences for Peer Leadership and control students in alternative high schools. The percentages of advisees and Peer Leaders absent "0 days" were less than the respective percentages for the control groups each semester. The percentages of advisees and Peer Leaders absent "11 or more" days exceeded the percentage for the control group each semester, with one exception. The percentage of Peer Leaders absent "11 or more days" in the first semester was lower than the control Peer Leader percentage.

The largest percentage of Peer Leaders and advisees in both the Peer Leadership and control alternative schools for the first and second semester fell in the category of "11 or more days" of absence with one exception. The largest percentage of control Peer Leaders for the second semester was in the category of "0 days" absent.

When the two highest categories of days absent are combined, the percentages of program advisees and Peer Leaders absent six (6) or more days

was higher than the percentages for control advisees and Peer Leaders for both semesters, with one exception. The percentage of first semester Peer Leaders absent 6 or more days was not as high as the percentage for control Peer Leaders. The percentages of students in the alternative schools absent six (6) or more days was as follows:

1st semester advisees	--	79% program vs. 67% control
2nd semester advisees	--	73% program vs. 58% control
1st semester Peer Leaders	--	69% program vs. 81% control
2nd semester Peer Leaders	--	74% program vs. 44% control

Course Data

Regular High Schools:

Table 5 is a summary of course failure data for Peer Leadership and control students in regular high schools. The percentages of program advisees and Peer Leaders who did not fail any courses first and second semesters was higher than the percentages for control advisees and Peer Leaders. The percentages of program advisees and Peer Leaders who failed two or more courses were lower than the percentages for control advisees and Peer Leaders first and second semesters.

The percentage of program advisees and Peer Leaders who failed one course was greater than the corresponding control percentages first semester. For second semester, the percentage of program advisees failing one course exceeded the control advisee percentage, but the percentage of program Peer Leaders who failed one course was lower than the percentage for control Peer Leaders.

Alternative Schools:

Table 6 provides a summary of course failure data for Peer Leadership and control students in alternative high schools. Smaller percentages of program advisees and Peer Leaders did not fail any courses than the percentages for control advisees and Peer Leaders both semesters.

The percentages of program advisees and Peer Leaders failing one course exceeded the percentages for control advisees and Peer Leaders for first semester. Second semester there was a smaller percentage of program advisees failing one course than the percentage for control advisees, but there was a larger percentage of program Peer Leaders failing one course than the percentage for control Peer Leaders.

The percentages of students failing two or more courses was higher among program advisees than control advisees first semester, and higher among program advisees and Peer Leaders than control advisees and Peer Leaders for the second semester. The percentage of first semester Peer Leaders failing two or more courses was lower than the percentage for control Peer Leaders.

The highest percentage of program advisees failed two or more courses both semesters, whereas, the highest percentage of control advisees failed no courses.

The highest percentages of program and control Peer Leaders failed no courses first and second semesters.

Discussion

This data is descriptive in nature, and caution should be used in interpretation, especially since the students, reflected in the Douglass High program, are the original students and perhaps not those involved during the second semester. Some trends are evident from the data.

For the regular high schools, the absence data and course failure data tend to favor the Peer Leadership group, both advisees and Peer Leaders, over the control group. There were lower percentages of students absent "11 or more days" among program participants than among the control group. There were higher percentages of program participants than control students who did not fail any courses and there were lower percentages of program participants than control students who failed two or more courses.

The data trends for the alternative schools are contrary to those of the regular high schools. The attendance data and course failure data tend to favor the control group over the Peer Leadership participants. The control group usually had lower percentages of students absent "11 or more days" and usually had lower percentages of students failing two or more courses. The control group in the alternative schools also had higher percentages of students who did not fail any courses than the alternative school Peer Leadership group. Also, the control group in the alternative schools usually had lower percentages of students failing 2 or more courses than the alternative school Peer Leadership group.

Conclusions

The Peer Leadership Connection should be continued in the regular high schools, but discontinued or extensively reviewed and modified in the alternative schools.
